

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered). Please AMEND claims 1, 2, 10, 12-15, 19-22 and ADD new claim 23 in accordance with the following:

1. (CURRENTLY AMENDED) An optical path simulation CAD system comprising:

an optical model creation unit creating and allowing a display of a three-dimensional optical model in which one or more optical components are disposed on an optical path extending from a light source to a final arrival position; and

an optical axis auto-creation unit figuring out, based on predetermined set parameters, a cylindrical optical axis model having a predetermined optical axis diameter and length indicative of behaviors of beams of light in said three-dimensional optical model, said optical axis auto-creation unit arranging and displaying said optical axis model in said three-dimensional optical model, for verification;

wherein for said optical component(s) interposed between said light source and a final arrival position, said optical axis auto-creation unit creates output-side optical axis model(s) in conformity with optical functions of said optical component(s) from input optical axis model(s), to arrange said output-side optical axis model between said optical component and a next adjacent optical component or said final arrival position, and

wherein in case said optical component lying on said optical path is a movable reflecting mirror that is capable of swinging around a predetermined rotational axis, said optical axis auto-creation unit is able to designate as control parameters the position of said rotational axis and the angle of a reflection surface within a three-dimensional space, said optical axis auto-creation unit automatically creating and arranging reflected optical axis models from input optical axis models on the basis of said control parameters.

2. (PREVIOUSLY PRESENTED) A system according to claim 1, wherein

said optical axis auto-creation unit defines for said optical axis model, the optical axis diameter and the color of a beam of light emitted from said light source, said optical axis auto-creation unit creating and arranging as said optical axis model, a cylindrical shape having a length starting from said light source and ending in an input surface of a next adjacent optical component lying on said optical path.

3. (ORIGINAL) A system according to claim 2, wherein

said optical axis auto-creation unit varies the optical axis diameter of said optical axis model as a function of the distance from the starting point.

4. (CANCELLED)

5. (CANCELLED)

6. (CURRENTLY AMENDED) A system according to claim 4_1, wherein

in case said optical component lying on said optical path is a polygon mirror that has a plurality of mirror faces formed on its periphery and that rotates at a certain angular velocity, said optical axis auto-creation unit previously defines the structures of said plurality of mirror faces, figures out the positions of said mirror faces within a three-dimensional space and the angles of the reflection surfaces from mirror rotational angles, and automatically creates and arranges an optical axis model reflected on a specific mirror face from an input optical axis model.

7. (ORIGINAL) A system according to claim 1, wherein

in case said optical component lying on said optical path is a lens, said optical axis auto-creation unit previously defines optical functions of said lens and automatically creates an output-side optical axis model in conformity with said optical functions from an input optical axis model, to arrange said output-side optical axis model between said optical component and a next adjacent optical component or an image forming face.

8. (ORIGINAL) A system according to claim 1, wherein

said optical axis auto-creation unit provides a display of an optical axis ending point at a position where an optical axis model intersects said final arrival face, said optical axis auto-creation unit recording coordinates of said ending point into a file.

9. (ORIGINAL) A system according to claim 1, wherein

said optical axis auto-creation unit defines a boundary wall model indicative of an optical axis extension limit around said three-dimensional optical model, said optical axis auto-creation unit if said optical path has no final arrival position providing an ending point, setting the position of said boundary wall model which said optical axis model intersects as an ending point of an extended optical axis model.

10. (PREVIOUSLY PRESENTED) A system according to claim 1, wherein

said optical axis auto-creation unit previously defines time-sequential variations of control parameters of said optical components lying on said optical path extending from said light source to an image forming face, said optical axis auto-creation unit allowing said three-dimensional model to perform continuous actions in accordance with said time-sequential variations of said control parameters, to thereby display a desired ending point trace in the shape of a letter or a symbol on a final arrival face and to record coordinates of said ending point into a file.

11. (ORIGINAL) A system according to claim 10, wherein

said optical axis auto-creation unit converts coordinate values of said ending point coordinates recorded in said file, into dot data, for the output from a printer.

12. (CURRENTLY AMENDED) An optical path simulation method comprising:

creating and displaying a three-dimensional optical model in which one or more optical components are disposed on an optical path extending from a light source to a final arrival position; and

calculating based on predetermined set parameters a cylindrical optical axis model having a predetermined optical axis parameter and length indicative of behaviors of beams of light in said three-dimensional optical model, to arrange and provide a display of said optical axis model in said three-dimensional optical model, for verification-; and

for said optical component(s) interposed between said light source and a final arrival position, creating outside-side optical axis model(s) in conformity with optical functions of said optical component(s) from input optical axis model(s), to arrange said output-side optical axis model between said optical component and a next adjacent optical component or said final arrival position,

wherein in case said optical component lying on said optical path is a movable reflecting mirror that is capable of swinging around a predetermined rotational axis, it is possible to designate as control parameters the position of said rotational axis and the angle of a reflection surface within a three-dimensional space so that reflected optical axis models are automatically created, for arrangement, from input optical axis models on the basis of said control parameters.

13. (PREVIOUSLY PRESENTED) A method according to claim 12 further comprising:

defining for said optical axis model, the optical axis diameter and the color of a beam of light emitted from said light source; and

creating and arranging, as said optical axis model, a cylindrical shape having a length starting from said light source and ending in an input surface of a next adjacent optical component lying on said optical path.

14. (PREVIOUSLY PRESENTED) A method according to claim 13 further comprising:

varying the optical axis diameter of said optical axis model as a function of the distance from the starting point.

15. (CANCELLED)

16. (CANCELLED)

17. (CURRENTLY AMENDED) A method according to claim ~~45~~12, wherein

in case said optical component lying on said optical path is a polygon mirror that has a plurality of mirror faces formed on its periphery and that rotates at a certain angular velocity, the structures of said plurality of mirror faces are previously defined so that the positions of said mirror faces within a three-dimensional space and the angles of the reflection surfaces are figured out from mirror rotational angles and so that an optical axis model reflected on a specific mirror face is automatically created, by arrangement, from an input optical axis model.

18. (ORIGINAL) The method according to claim 12, wherein

in case said optical component lying on said optical path is a lens, optical functions of said lens are previously defined so that an output-side optical axis model in conformity with said optical functions is automatically created from an input optical axis model and is arranged between said optical component and a next adjacent optical component or an image forming face.

19. (PREVIOUSLY PRESENTED) A method according to claim 12, further comprising:

providing a display of an optical axis ending point at a position where an optical axis model intersects said final arrival face; and

recording coordinates of said ending point into a file.

20. (PREVIOUSLY PRESENTED) A method according to claim 12, further comprising:

defining a boundary wall model indicative of an optical axis extension limit around said three-dimensional optical model; and

if said optical path has no final arrival position providing an ending point, setting the position of said boundary wall model which said optical axis model intersects as an ending point of an extended optical axis model.

21. (PREVIOUSLY PRESENTED) A method according to claim 12, further comprising:
previously defining time-sequential variations of control parameters of said optical components lying on said optical path extending from said light source to an image forming face;
and

allowing said three-dimensional model to perform continuous actions in accordance with said time-sequential variations of said control parameters, to thereby display a desired ending point trace in the shape of a letter or a symbol on an image forming face and to record coordinates of said ending point into a file.

22. (PREVIOUSLY PRESENTED) A method according to claim 21, further comprising:
converting coordinate values of said ending point coordinates recorded in said file, into dot data, for the output from a printer.

23. (PREVIOUSLY PRESENTED) An optical path simulation method comprising:
creating a three-dimensional optical model in which at least one optical component is disposed on an optical path between a light source and a destination position; and
calculating a cylindrical optical axis model having a predetermined optical axis parameter and length indicative of behaviors of beams of light in the three-dimensional optical model; and
displaying the optical axis model in the three-dimensional optical model, for verification.

24. (NEW) An optical path simulation CAD system comprising:
an optical model creation unit creating and allowing a display of a three-dimensional optical model in which one or more optical components are disposed on an optical path extending from a light source to a final arrival position; and
an optical axis auto-creation unit figuring out, based on predetermined set parameters, a cylindrical optical axis model having a predetermined optical axis diameter and length indicative of behaviors of beams of light in said three-dimensional optical model, said optical axis auto-creation unit arranging and displaying said optical axis model in said three-dimensional optical model, for verification.

25. (NEW) An optical path simulation method comprising:

creating and displaying a three-dimensional optical model in which one or more optical components are disposed on an optical path extending from a light source to a final arrival position; and

calculating based on predetermined set parameters a cylindrical optical axis model having a predetermined optical axis parameter and length indicative of behaviors of beams of light in said three-dimensional optical model , to arrange and provide a display of said optical axis model in said three-dimensional optical model, for verification.
